

Lunar ROADSTER

(Robotic Operator for Autonomous Development of
Surface Trails and Exploration Routes)

“Starting with a foothold on the Moon, we pave the way to the cosmos”

The Team

Ankit Aggarwal

Deepam Ameria

Bhaswanth Ayapilla

Simson D'Souza

Boxiang (William) Fu

Dr. William "Red" Whittaker

Motivation: The Lunar Polar Highway

CIRCUMNAV

Is it possible for a solar-powered rover to repeatedly
drive around the Moon and never encounter a sunset?

Motivation: The Lunar Polar Highway

Sun-synchronous circumnavigation around Moon at
28 days x 24 hr = 672 hour sun rotation

At equator	11,000 km	16 kph
At 50 deg	7,040 km	10 kph
At 60 deg	5,500 km	8 kph
At 70 deg	3,700 km	6 kph
At 75 deg	2,800 km	4 kph
At 80 deg	1,870 km	3 kph
At 81 deg	1,529 km	2.5 kph

Jogging speed if the route
was flat, circular and
traversable

The Project: Lunar ROADSTER

An autonomous **moon-working** rover capable of finding ideal exploration routes and creating traversable surface trails.

By **grooming trail paths**, rovers with less traversing capabilities will be able to travel at higher speeds and higher power efficiencies.

A traversable and circuitous trail path will allow rovers to **maintain sun-synchronicity**, thereby allowing machines to run for much longer.

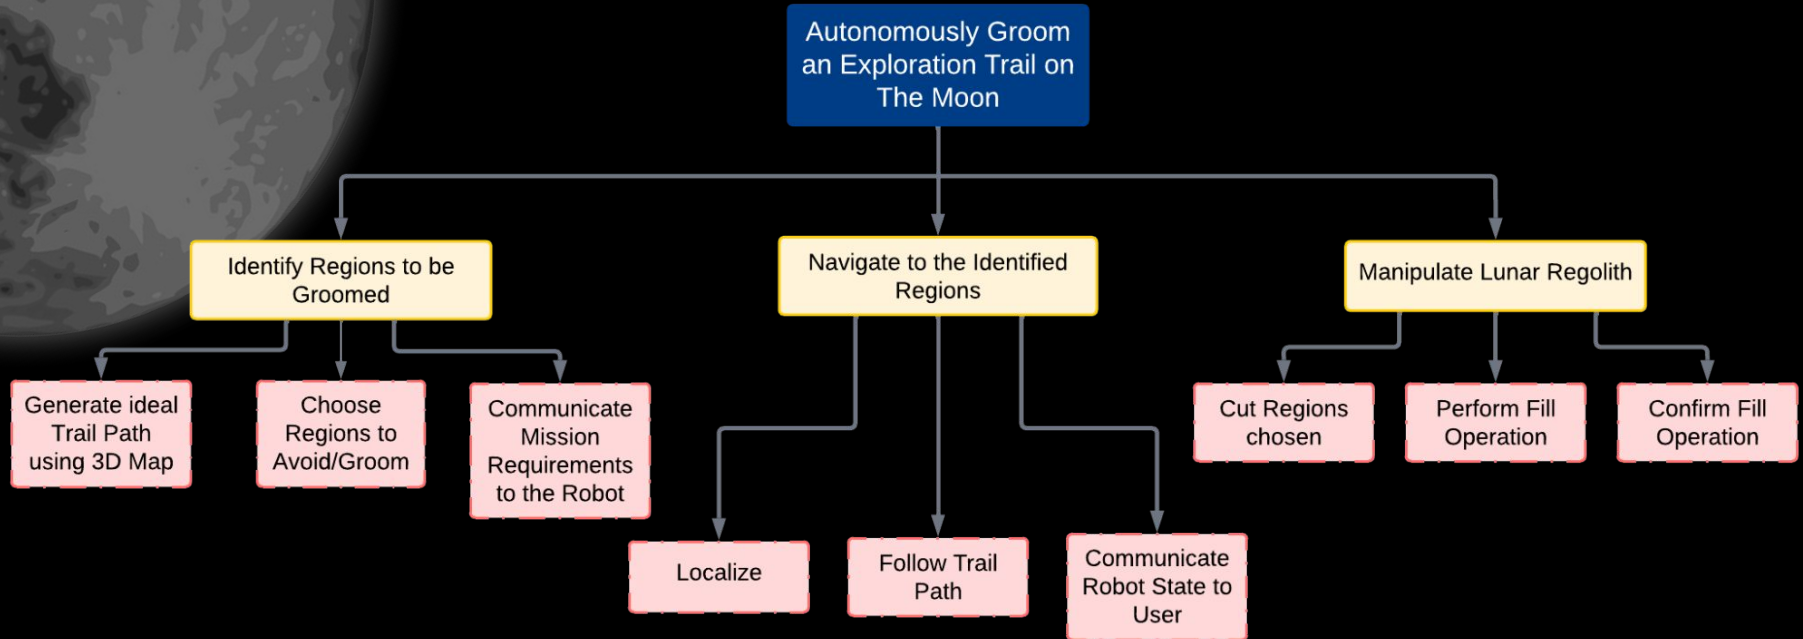

The groomed trails will become the **backbone for colonization** of the Moon by enabling transportation, logistics and enterprise development.

Use Case: Circular Path Grooming

Objectives Tree

Functional Requirements (Mandatory)

Sr. No.	Mandatory Functional Requirement
M.F.1	Shall perform trail path planning
M.F.2	Shall operate autonomously
M.F.3	Shall localize itself in a GPS denied environment
M.F.4	Shall navigate the planned path
M.F.5	Shall traverse uneven terrain
M.F.6	Shall choose craters to groom and avoid
M.F.7	Shall grade craters and level dunes
M.F.8	Shall validate grading and trail path
M.F.9	Shall communicate with the user

Non-Functional Requirements (Mandatory)

Sr. No.	Parameter	Description
M.N.1	Weight	The rover must weigh under 50kg
M.N.2	Cost	The cost for the project must be under \$5000
M.N.3	Computing Capacity	The onboard computer should be able to run all required tasks
M.N.4	Size/Form Factor	The rover should measure less than 1m in all dimensions

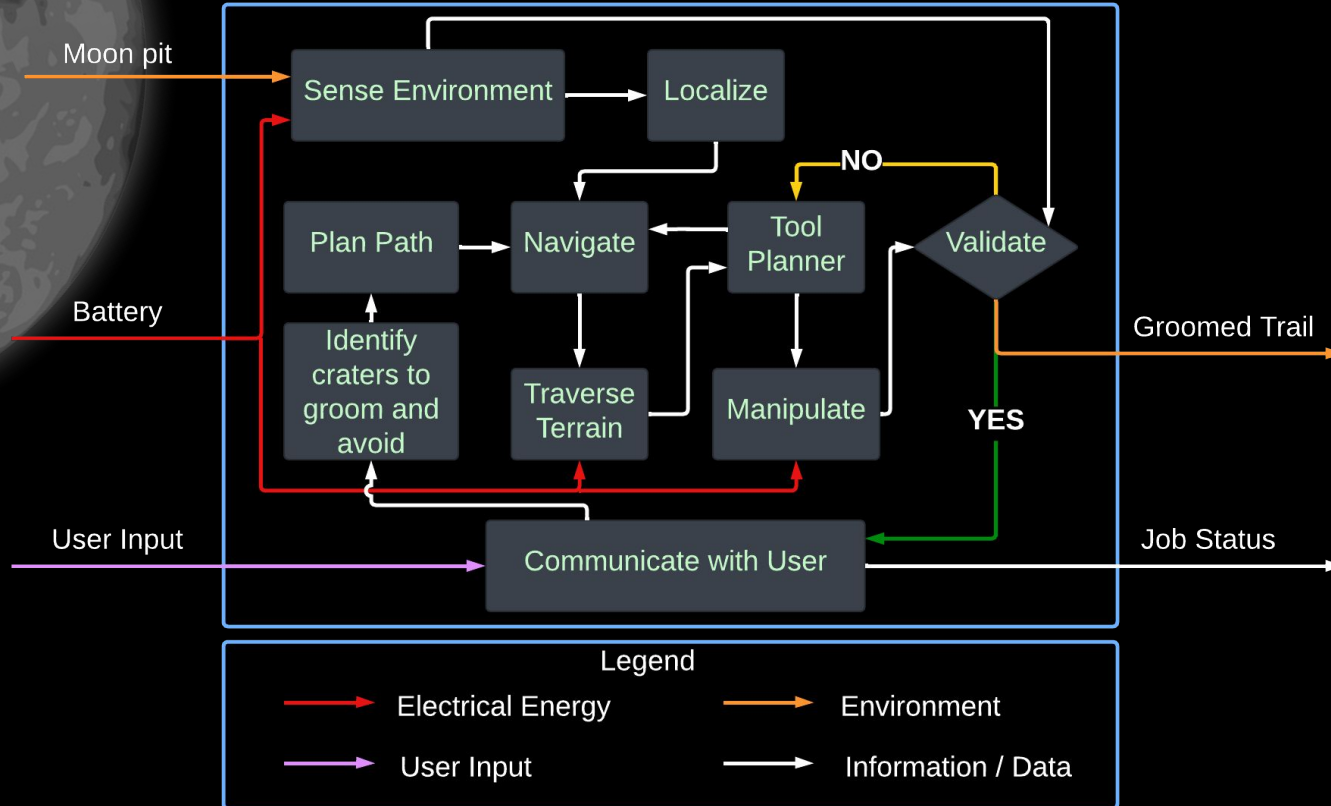

Non-Functional Requirements (Desirable)

Sr. No.	Parameter	Description
D.N.1	Technological Extensibility	The system will be well documented and designed so that future teams can easily access and build on the work
D.N.2	Aesthetics	Requirement from sponsor, the rover must look presentable and lunar-ready
D.N.3	Modularity	To enable tool interchangeability , the tool assemblies must be modular and easy to assemble/disassemble
D.N.4	Repeatability	The system will complete multiple missions without the need of maintenance

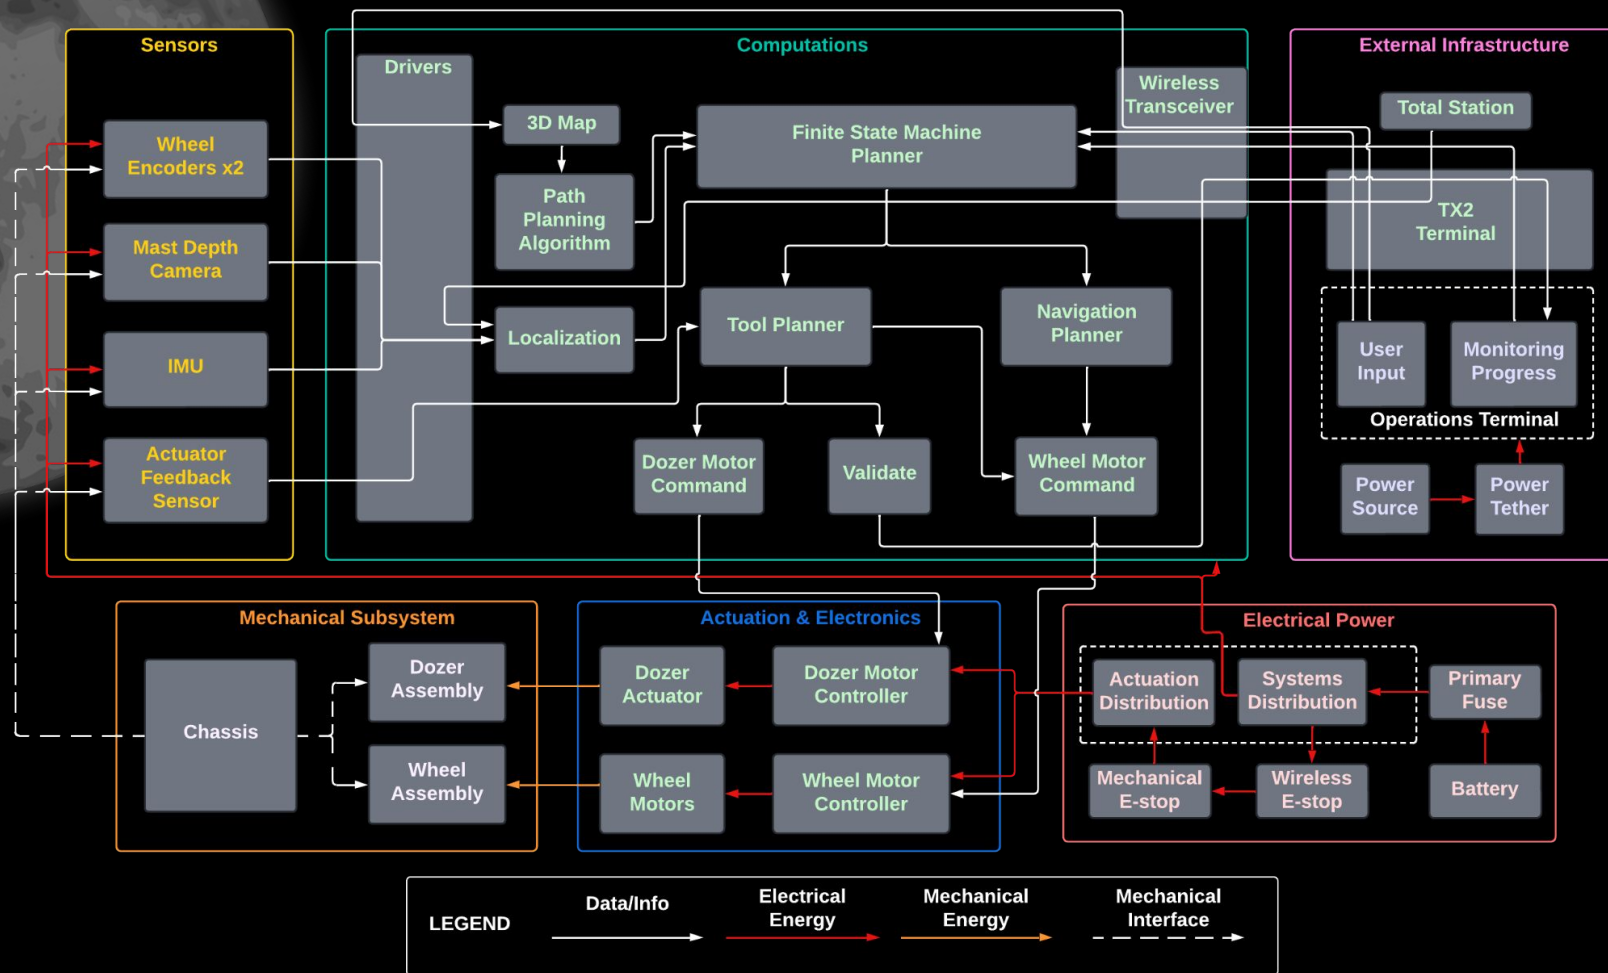

Performance Requirements (Mandatory)

Sr. No.	Performance Metrics
M.P.1	Will plan a path with cumulative deviation of $\leq 25\%$ from chosen latitude's length
M.P.2	Will follow planned path to a maximum deviation of 10%
M.P.3	Will climb gradients up to 15° and have a contact pressure of less than 1.5 kPa
M.P.4	Will avoid craters ≥ 0.5 metres and avoid slopes $\geq 15^\circ$
M.P.5	Will fill craters of up to 0.5 meters in diameter and 0.1m in depth
M.P.6	Will groom the trail to have a maximum traversal slope of 5°

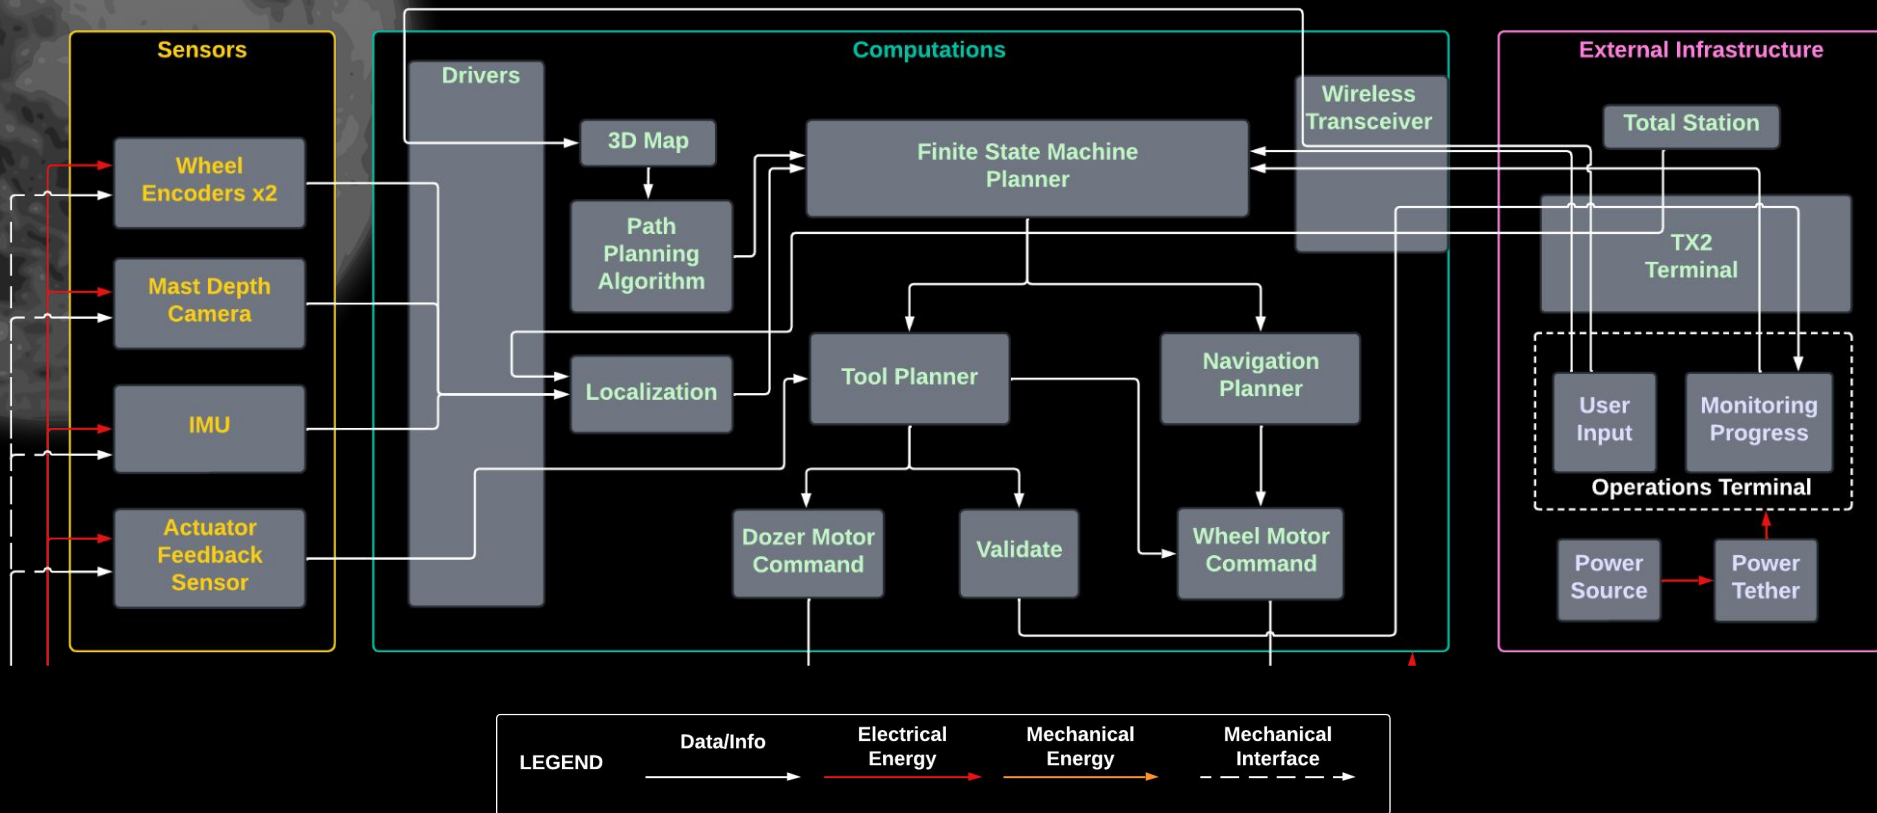

Functional Architecture

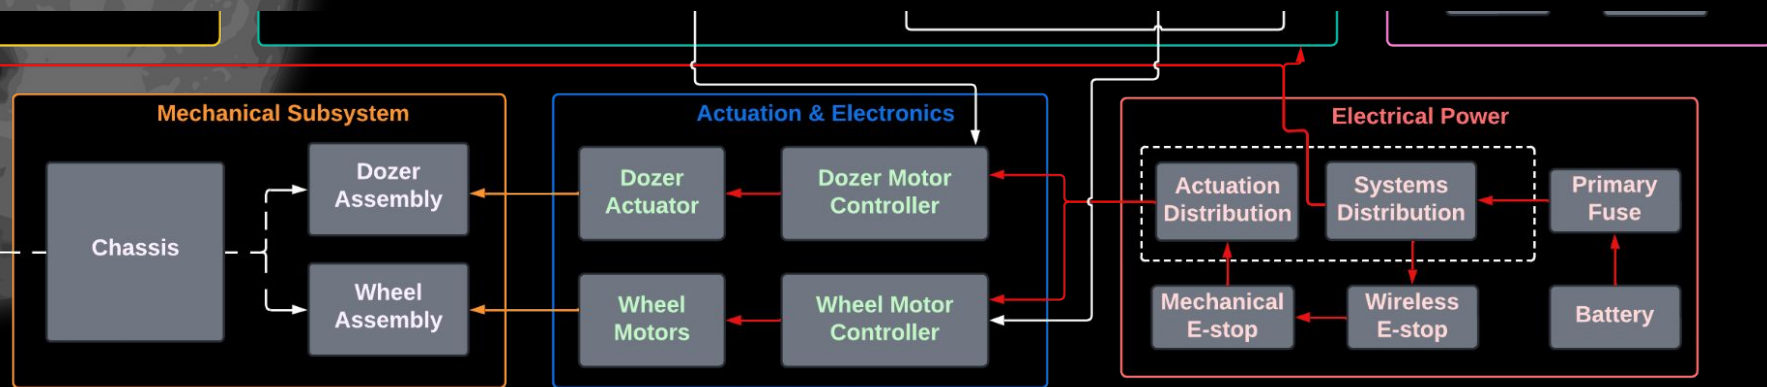

Cyber-Physical Architecture

Cyber-Physical Architecture

Cyber-Physical Architecture

Current System Status

Targeted Requirements in Spring

Requirement	Description	Status
M.P.1	Will plan a path with cumulative deviation of $\leq 25\%$ from chosen latitude's length	Achieved
M.P.2	Will follow planned path to a maximum deviation of 10%	Demonstrated
M.P.4 (Part 1)	Will avoid craters ≥ 0.5 metres	Demonstrated
M.P.5	Will fill craters of up to 0.5 meters in diameter and 0.1m in depth	Demonstrated
M.N.1	Weight - The rover must weigh under 50kg	Achieved
M.N.4	Size - The rover should measure less than 1m in all dimensions	Missed
D.N.1	Technological Extensibility - The system will be well documented and designed so that future teams can easily access and build on the work	Achieved
D.N.2	Aesthetics - Rover must look presentable and lunar-ready	Demonstrated

Subsystem Completion Status

Subsystem	Completion %	Future Work
Sensors	75%	Upgrade RealSense D235i to ZED 2i stereo camera
Computations	60%	
1. Jetson and Docker	95%	Integrate ZED drivers
2. Localization Unit	85%	Address frame shifts caused by battery replacements
3. Transport Planner Unit	60%	Implement unit
4. Navigation Planner Unit	90%	Tune navigation stack
5. FSM Planner Unit	95%	Integrate validation unit into FSM
6. Validation Unit	10%	Implement unit
External Infrastructure	100%	None
Mechanical	90%	
1. Dozer Assembly	90%	Refinement of dozer
2. Wheel Assembly	90%	Wheel design iterations, final manufacturing
Actuation	80%	Linear actuator upgrade/tuning, torque sensing
Electrical Power	90%	Change battery placement

Description: Sensors Subsystem

Description: All sensors used on the rover for computations.

Requirements:

- Wheel Encoders (x4)
- Mast Depth Camera (RealSense D435i)
- IMU (VectorNav)
- Actuator Feedback Sensor

Expected Functionality: The sensor data is published to various ROS topics and can be used inside the Docker container to perform computations.

Status: Sensors Subsystem

```
williamfbx@williamfbx-ubuntu: ~/Lunar-ROADSTER/lr_ws
williamfbx@williamfbx-ubuntu:~/Lunar-ROADSTER/lr_ws$ ros2 topic list
/parameter_events
/rosout
/vectornav/gnss
/vectornav/imu
/vectornav/imu_uncompensated
/vectornav/magnetic
/vectornav/pose
/vectornav/pressure
/vectornav/raw/attitude
/vectornav/raw/common
/vectornav/raw/gps
/vectornav/raw/gps2
/vectornav/raw/imu
/vectornav/raw/ins
/vectornav/raw/time
/vectornav/temperature
/vectornav/time_gps
/vectornav/time_pps
/vectornav/time_startup
/vectornav/time_syncin
/vectornav/velocity_aiding
/vectornav/velocity_body
williamfbx@williamfbx-ubuntu:~/Lunar-ROADSTER/lr_ws$
```

Implementation:

- IMU implemented using VectorNav ROS package
- Wheel Encoder parsed using micro-ROS
- Purchased actuator has a feedback potentiometer
- Obtained RealSense point cloud feed using RealSense ROS wrappers

Challenges:

- Difficulty integrating ZED SDK with docker container due to CUDA compatibility issues
- Reverted back to using RealSense, which did not require CUDA
- IMU firmware drivers were outdated

Status: 75% Complete

IMU, wheel encoder, and linear actuator finalized.
Upgrade RealSense to ZED 2i in Fall semester

Evaluation: Sensors Subsystem

Modelling:

- CAD designed and 3D printed mast depth camera mounts of 30, 40, 45, and 50 degree angles relative to mast

Analysis:

- 50 degree angled camera mount gives the best view of craters
- However, if tool height is above 15%, occlusion occurs
- Point cloud obtained from RealSense is not as dense as ZED 2i

Testing:

- T10: Optimal Mast Depth Camera Placement Test
- T14: Maintenance, Reliability and Quality Assurance Test

Description: Computations Subsystem Jetson and Docker Unit

Description: Set up the Jetson AGX Xavier with Docker to host and run all critical system packages

Requirements:

- NVIDIA Jetson AGX Xavier
- LAN Router
- Team laptop (operations terminal)

Expected Functionality:

- Acts as primary on-board compute
- Runs ROS2 Humble
- Runs micro-ROS
- Hosts and manages all necessary packages and device drivers inside Docker containers

```
Tilix: root@6698373d4184:~/Lunar_ROADSTER/lr_ws
1:root@6698373d4184:~/Lunar_ROADSTER/lr_ws
~/sd_card/Lunar-ROADSTER/lr_ws main 13 71 > ls
docker docker-compose.yml src
~/sd_card/Lunar-ROADSTER/lr_ws main 13 71 > sudo docker start -l lunar_roadster_dev_jetson

Lunar ROADSTER

~/Lunar_ROADSTER/lr_ws
> ls
docker docker-compose.yml src
```

Status: Computations Subsystem

Jetson and Docker Unit

Implementation:

- Connect Jetson to rover's power system
- Assigned static IP on the LAN to enable SSH-based remote access from operations terminal
- Start docker container and initialize all core services and packages

Challenges:

- Setup of a VNC server for remote GUI access

Status: 95% Complete
Need to integrate ZED SDK drivers

Evaluation: Computations Subsystem

Jetson and Docker Unit

LunarROADSTER / lr_ws / docker / lrdev_jetson.dockerfile 

 LunarROADSTER added realsense drivers

Modelling:

- Created custom Dockerfile that installs all required system packages

Analysis:

- Verified that all required nodes and drivers start successfully inside the container

Testing:

- T03: Depth Camera Connectivity Test

Upgrade to higher performance
Jetson – Fall Goal

Description: Computations Subsystem Localization Unit

Description: Localize the rover in the Moon Yard

Requirements:

- Leica TS16 Total Station
- NVIDIA TX2 Relay Chip + LAN
- VectorNav IMU
- Wheel Encoders

Expected Functionality: Accurately localize rover pose inside the Moon Yard, to be used further for navigation

Status: Computations Subsystem Localization Unit

Implementation:

- On-board IMU and encoders used for local localization
- Total station data fused with IMU and encoders for global localization
- EKF running on Jetson using robot_localization package, now tuned to prevent odometry drift
- Yaw calibration to ensure IMU data is w.r.t map frame

Challenges:

- Incorrect Jetson Docker network permissions blocked two-way communication
- Minor offset introduced when total station battery is replaced, causing frame inconsistencies

Status: 85% Complete

Address frame shifts caused by total station battery replacements

Evaluation: Computations Subsystem Localization Unit

Modelling:

- Configured and tuned EKF to fuse sensor inputs
- Set up frame transforms to ensure all sensor data aligns properly at base_link frame
- Performed yaw calibration to ensure consistent orientation data from IMU

Analysis:

- Analyzed pose stability and drift over time during testing
- Analyzed sensor noise and measurement delays, tuning EKF parameters to minimize odometry drift
- Assessed effect of total station resections and battery swaps on accuracy

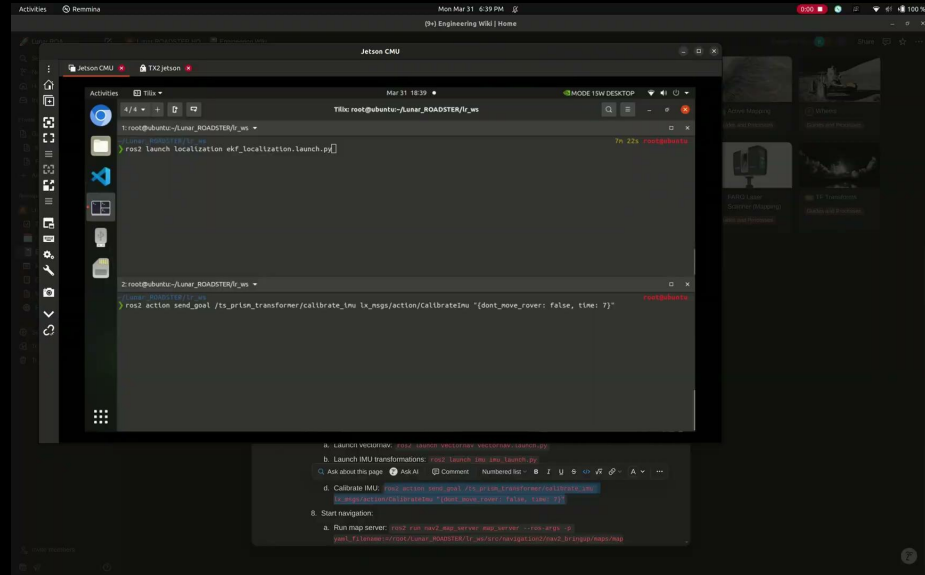

Testing:

- T09: Rover can localize itself accurately
- T15: Spring Validation Demo Test

Evaluation: Computations Subsystem Localization Unit

Localization drift issue

Drift corrected + Yaw calibrated

New localization method using SkyCam to be implemented
to remove total station dependency – Fall Goal

Description: Transport Planner Unit

Description: Subsystem that plans sand manipulation by using the tool and drive train.

Requirements

- Jetson Xavier AGX
- Dozer Assembly
- Drivetrain (with Wheel Assembly)
- Global Map

Expected Functionality

- Plans a control input for the tool
- Plans a trajectory for the rover for manipulation
- Outputs waypoints and tool trajectories to the navigation planner

Status: Transport Planner Unit

Implementation:

- Global Map is used to identify source and sink nodes.
- Transport Assignments are generated between sources and sinks, based on minimizing a cost function
- ROADSTER Waypoints are obtained from the filtered assignments to generate paths and tool trajectories.
- Methodology needs to be adapted for multiple craters

Challenges:

- Processing a dense point cloud
- Modelling tool size within the subsystem for optimal plans

Status: 60% complete

Evaluation: Transport Planner Unit

Description: Computations Subsystem

Navigation Planner Unit

Description: Identify gradable craters, obtain coordinates, and navigate the rover to their locations

Requirements:

- FARO Laser Scanner
- NVIDIA Jetson AGX Xavier
- Team laptop (operations terminal)

Expected Functionality:

- Accurately detect and classify gradable craters
- Ensure no gradable crater is overlooked
- Compute an optimal navigation path while avoiding obstacles (non-gradable craters and rocks)
- Navigate and reach the goal location correctly

Status: Computations Subsystem

Navigation Planner Unit

**Moon Yard Scan
Visualization**

Global Costmap

Implementation:

- Mapped the Moon Yard using the FARO Laser Scanner to generate a point cloud.
- Converted the point cloud file into a ROS-compatible format.
- Applied RANSAC for plane fitting and implemented thresholding to generate a 2D costmap for navigation.
- Identified craters based on diameter and depth, extracting their coordinates.
- Integrated navigation with tool planner to perform transport assignments

Challenges:

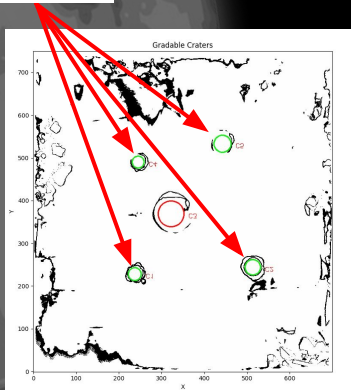

- FARO output file (.fls) was incompatible with the PCL library and ROS.
- Plane fitting for identifying gradable craters was challenging due to uneven terrain.
- Accurately classifying gradable craters based on diameter and depth.
- Fine-tune Nav2 parameters for optimal performance on our robot and ensure accurate robot localization

Status: 90% Complete (Tune Navigation Stack) - Fall Goal

Evaluation: Computations Subsystem

Navigation Planner Unit

Gradable Craters

Identified Gradable Craters

```
Gradable Craters Location
Crater C1: Diameter = 0.300 meters
Centroid of Crater C1: X = 2.380 m, Y = 2.289 m

Crater C2: Diameter = 0.360 meters
Centroid of Crater C2: X = 5.131 m, Y = 2.443 m

Crater C3: Diameter = 0.600 meters

Crater C4: Diameter = 0.280 meters
Centroid of Crater C4: X = 2.453 m, Y = 4.909 m

Crater C5: Diameter = 0.400 meters
Centroid of Crater C5: X = 4.421 m, Y = 5.335 m
```

Gradable Craters Location

Modeling:

- Generated dense point cloud maps by taking multiple FARO scans and updated the map origin for consistent localization and navigation frames
- Tuned Nav2 parameters to suit Ackermann steering kinematics.
- Used RViz extensively to visualize and debug transformations and paths

Analysis:

- Evaluated planned paths for smoothness, obstacle avoidance, and feasibility
- Analyzed factors affecting navigation: localization noise, data delay, computation load, and parameter tuning

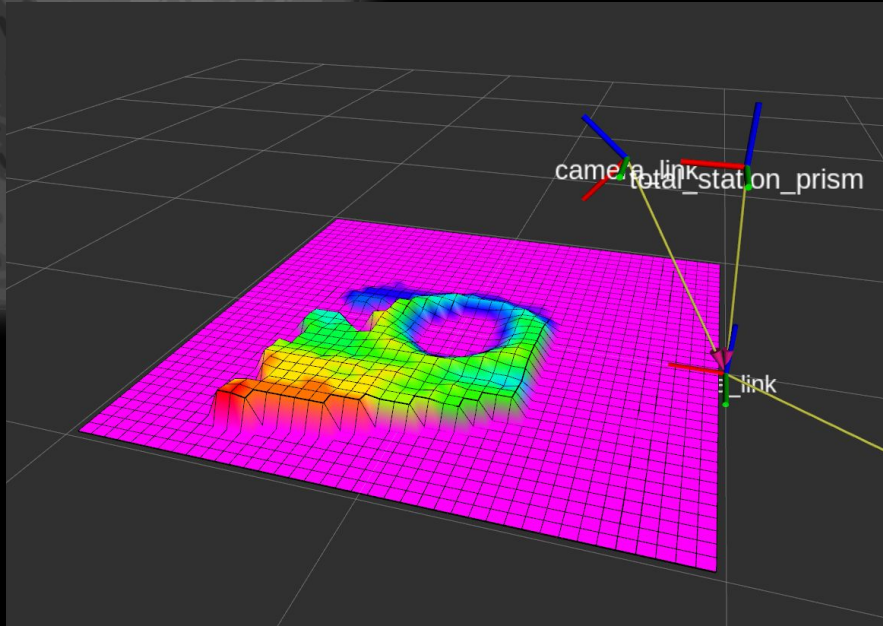

Testing:

- T08: Mapping the Moon Yard and visualize the point cloud data
- T11: Navigate and reach the goal location correctly
- T15: Spring Validation Demo Test

Evaluation: Computations Subsystem Navigation Planner Unit

Description: Computations Subsystem Validation Unit

Description: Validates if groomed crater satisfies maximum traversability requirement (M.P.6)

Requirements:

- RealSense D235i or ZED 2i stereo camera
- Camera driver packages
- Jetson Xavier AGX

Expected Functionality:

- Outputs trail RMSE elevation error and/or maximum traversal slope

Status: Computations Subsystem Validation Unit

Implementation:

- Preliminary implementation for SVD Encore by calculating RMSE relative to mean elevation
- Will implement full unit in Fall semester using mast camera

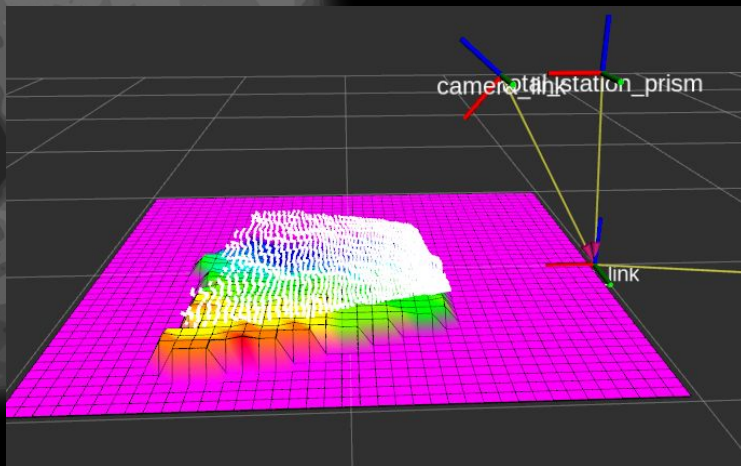

Challenges:

- Rover mast moves due to rover suspension. May cause errors in estimating the ground plane
- Compute is not enough for RealSense point cloud feed at 30 FPS

Status: 10% Complete

```
[info_logger_node-1] [INFO] [1745446813.600659910] [info_logger_node]: Mean Elevation:      1.41 cm
[info_logger_node-1] [INFO] [1745446813.600924924] [info_logger_node]: Elevation RMSE:          2.91 cm
[info_logger_node-1] [INFO] [1745446933.590001611] [info_logger_node]: Mean Elevation:          0.99 cm
[info_logger_node-1] [INFO] [1745446933.590321099] [info_logger_node]: Elevation RMSE:          1.90 cm
```

Evaluation: Computations Subsystem Validation Unit

Modelling:

- Calibrated camera $\{X, Y, Z, R, P, Y\}$ so that flat ground has zero elevation and no rotation

Analysis:

- Point cloud obtained from RealSense is not as dense as ZED 2i. May not be adequate for validation requirements

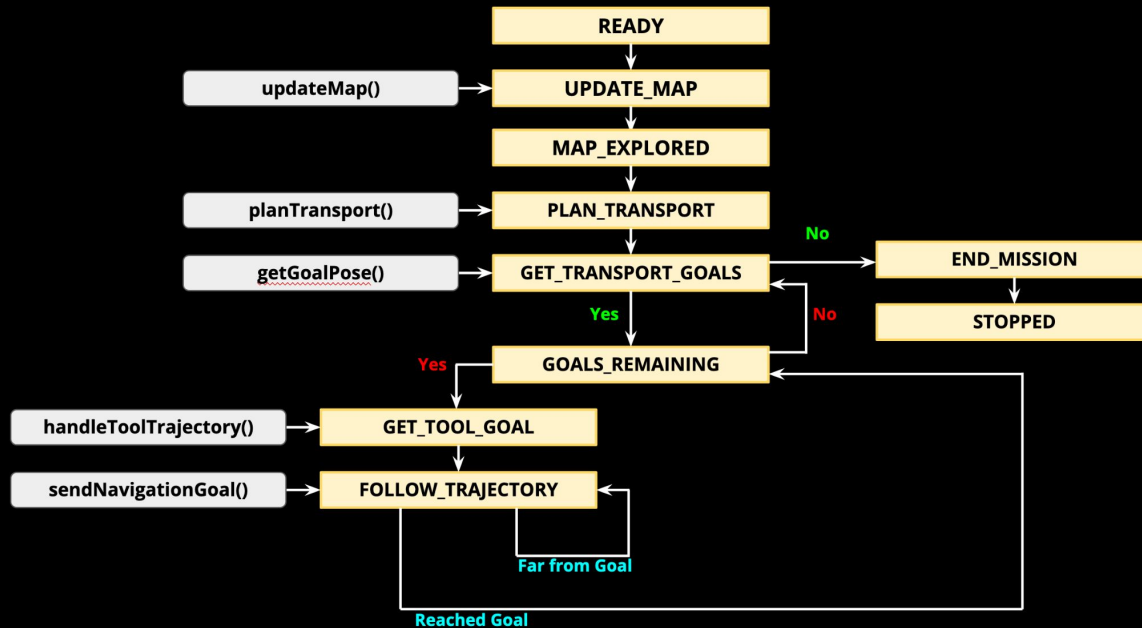

Testing:

- Milestone deadline set for PR8

Description: Computations Subsystem

Finite State Machine Unit

Description: High level behaviour tree for entire autonomy stack

Requirements:

- Sensors subsystem
- Computations subsystem
- External infrastructure
- Mechanical subsystem
- Actuation subsystem
- Electrical power subsystem

Expected Functionality:

- Entire system is able to grade craters autonomously

Status: Computations Subsystem

Finite State Machine Unit

Implementation:

- FSM callbacks implemented at 2 Hz
- Heavy computations parallelized and detached from main thread to not block FSM node from iterating

Challenges:

- Compute not sufficient for active mapping using RealSense

Status: 95% Complete

Integrate validation unit into FSM – Fall Goal

Evaluation: Computations Subsystem

Finite State Machine Unit

Modelling:

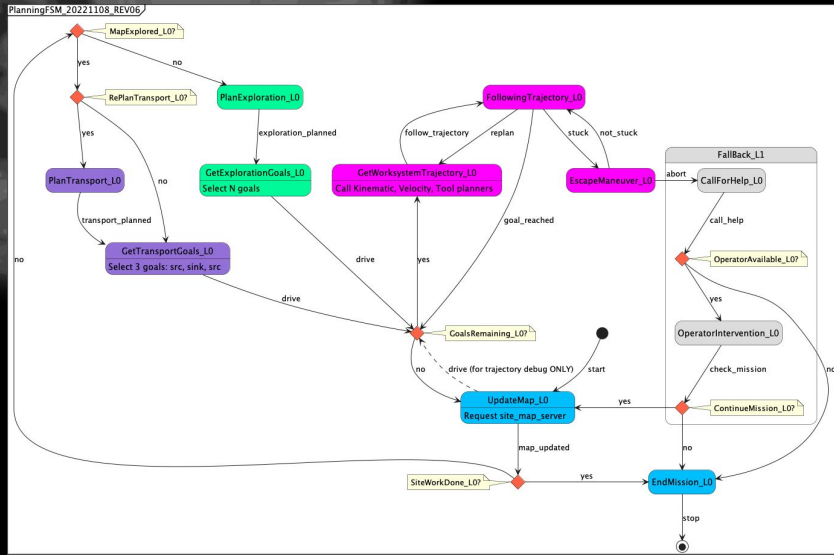

- Initial FSM design sourced from Crater Grader. Adapted design for our needs

Analysis:

- Computations take too long. Rover often completely stops for calculations
- Integrating active mapping sometimes causes topic messages to be missed due to high network layer traffic

Testing:

- T13: Integration Test
- T15: Spring Validation Demo Test

Description: External Infrastructure Subsystem

Description: Mission components deployed offboard the rover to support localization and communication

Requirements:

- Leica TS16 Total Station
- NVIDIA TX2 Relay Chip
- LAN Router
- Team laptop (operations terminal)

Expected Functionality:

- Accurately localize {X, Y, Z}-coordinates of the rover inside Moon Yard
- Establish two-way communication

Status & Evaluation: External Infrastructure Subsystem

Implementation:

- Total Station sends rover coordinates to TX2 relay chip, forwards data packet via LAN network to rover
- Established static IP on LAN network so operations terminal can communicate via SSH

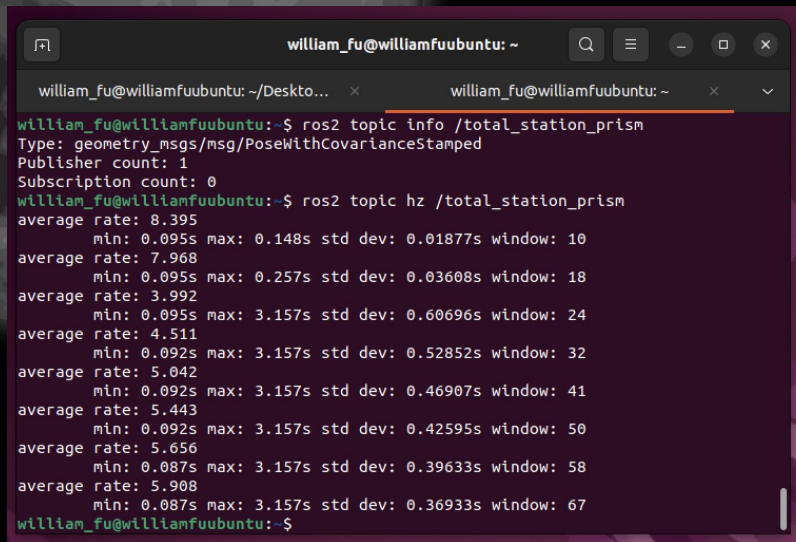

Challenges:

- Unable to obtain access to the TX2 relay chip login details
- Incorrect Jetson Docker network permissions blocked two-way communication

Status: Completed

Analysis: Investigated network permission issues inside Jetson Docker

Testing: T05: External Infrastructure Test

Description: Mechanical Subsystem

Dozer Assembly

Description: Lunar terrain manipulation tool

Requirements:

- Dozer blade
- Dozer arms assembly
- Linear actuator
- Arduino Due

Expected Functionality:

- Perform dozing of sand
- Perform backblading
- Actuate automatically based on commands from tool planner

Status: Mechanical Subsystem

Dozer Assembly Unit

Implementation:

- Research: Dozer shapes and sizes, actuation methodologies.
- Designed the dozer assembly (blade, arms, yoke, mounts) using SolidWorks.
- Shortlisted linear actuators of different gear ratios.
- Manufactured and assembled all parts on the rover.
- Testing with different actuators

Challenges:

- Fabrication problems
- Limited access to FRC Workshop

Status: 90% Complete

- Demonstrated automatic dozing and backblading capabilities of the assembly in SVD
- Refine the assembly by remanufacturing certain components

Evaluation: Mechanical Subsystem Dozer Assembly Unit

Excellent pushing and grading capability, owing to the shape and size of the blade, and the robust dozer arms

Improved yoke/actuator arch to be manufactured in Fall based on the actuator

Description: Wheel Assembly Unit

Description: Assembly that enables movement of the rover by acting as an interface between the drivetrain and ground.

Requirements:

- Wheel (3D Printed - PLA)
- Mounting Assembly to the Suspension
- Drive Train (Differential and Steering)
- Motors

Expected Functionality:

- Provide required traction for movement and grading of sand
- Minimize wheel slip
- Allow for steering in sand
- Desirable - Use materials that can function on the Lunar Surface

Status: Wheel Assembly Unit

Implementation:

- Design single-part iterations in SolidWorks
- 3D-print designs and test in the MoonYard
- Observe and re-design until the design is satisfactory

Challenges:

- 3D Printing the wheel is a long process with frequent failures
- Steering system of the rover is fragile and frequently disengages - solved.

Status: 90% Complete

- Demonstrated mobility and pushing power with 4 printed wheels in SVD
- Next iteration in Fall to make the design lighter.
- Integration of current sensing to measure wheel torque.

Evaluation: Wheel Assembly Unit

Great performance in traction and generating pushing power in all tests
Torque feedback to be integrated in the Fall to estimate traction and slip
Design can be optimized to be lighter - Fall goal

Description: Actuation Subsystem

Description: Power transfer methodologies for rover mechanisms.

Requirements:

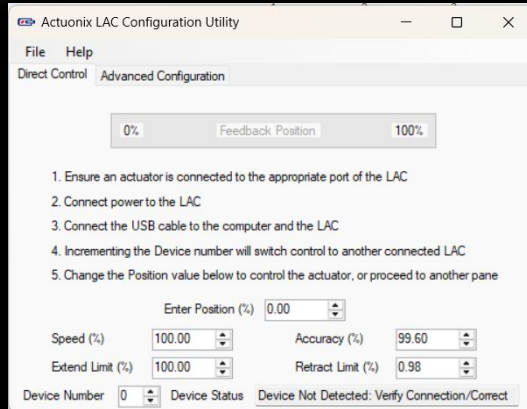

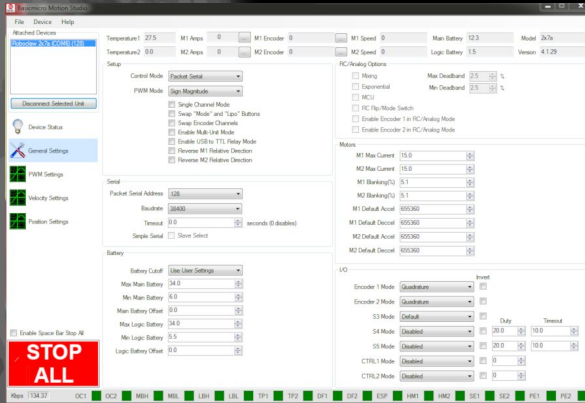

- DC Motors with Encoders (x4)
- Linear Actuator (with feedback)

Expected Functionality:

- Deliver power to wheels for mobility
- Steer the front and rear wheels
- Actuate the dozer assembly to facilitate mobility and dozing

Status: Actuation Subsystem

Implementation:

- Selected drive motors with higher torque for better traction and mobility
- Selected linear actuator for dozer assembly
- Interfaced drive motors and steering motors with Roboclaw motor controller
- Interfaced Actuator with Linear Actuator Controller Board and Arduino Due

Challenges:

- Mismatched gearing in motors caused non-uniform steering in front and rear
- Worn-out pinion gears
- Oscillations near setpoint of linear actuator under load.

Status: 90% Complete

- Demonstrated enhanced steering and driving in SVD
- Upgrade/tune linear actuator

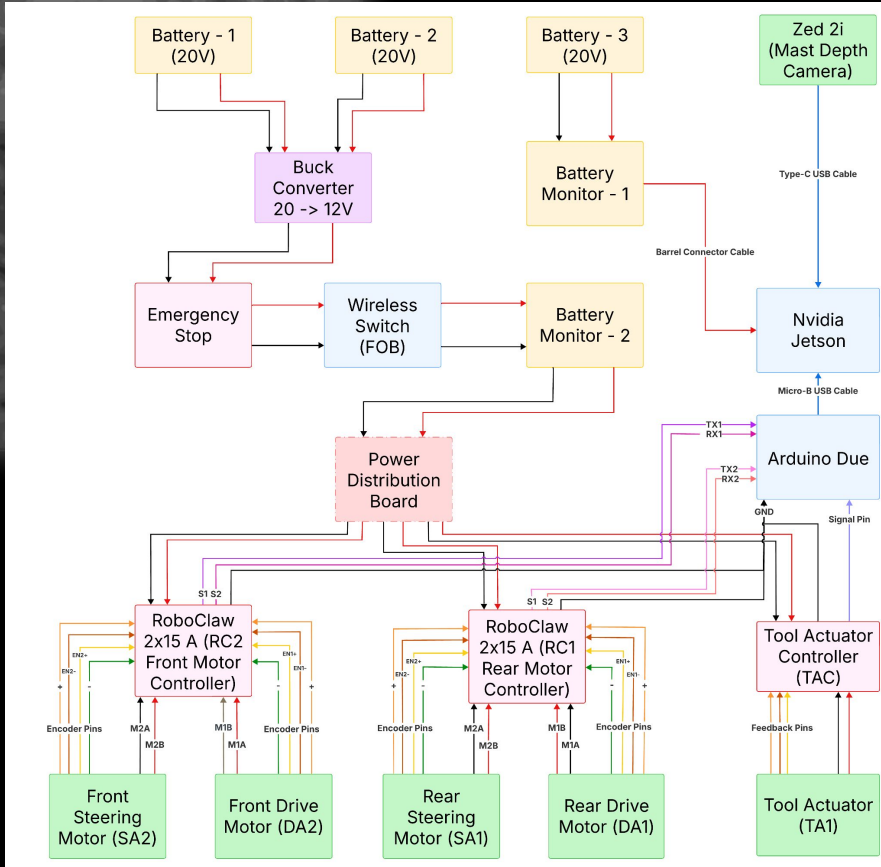

Evaluation: Actuation Subsystem

New drive motors provide adequate motion in the Moonyard. Actuator has the capability to lift the rover, as demonstrated in SVD.

Replace actuator for better and smoother performance - Fall goal

Description: Electrical Subsystem

Description: Rover's power and logic circuitry.

Requirements:

- Buck Converter (20 V -> 12 V)
- Power Distribution Board (PDB)
- RoboClaw Motor Controller - 2
- Linear Actuator Controller
- Linear Actuator
- Zed 2i Depth Camera
- E-Stop
- Wireless Switch
- IMU - VectorNav VN100
- Arduino Due
- Nvidia Jetson Xavier AGX
- Wireless Receiver for Joystick
- DC motors with Encoders

Expected Functionality:

- Distribute power efficiently to all rover components
- Ensure stable voltage levels for uninterrupted operation

Status: Electrical Subsystem

Implementation:

- Integrated new electrical components and designed a custom Power Distribution Board (PDB) based on updated power requirements
- Designed a compact and accessible electronic box to streamline the electrical subsystem setup
- Successfully integrated and tested the PDB within the rover's electrical system

Challenges:

- Understanding and adapting to the existing circuit design and limitations.
- Ensuring the compact design of the electronic box while maintaining accessibility and proper cooling.

Status: 90%

Integrating torque feedback sensing and updating battery position – Fall Goal

Evaluation: Electrical Subsystem

Modeling:

- Developed detailed circuit diagram integrating existing and new electrical components
- Modeled custom PDB with over-current, reverse-voltage, and power indication features
- Designed electronics box for minimal footprint, cooling, and accessibility

Analysis:

- Verified voltage and current demands for each subsystem component to ensure PDB output stability
- Assessed cable routing and hardware quality assurance

Testing:

- T07: Complete Hardware Test

Performance Evaluation in SVD

What went well?

1. Mechanical Design
2. Electronics Box Design
3. Transport Planner
4. Navigation Planner
5. Finite State Machine

What didn't go well?

1. Reliability of Autonomy
2. Demonstrating Performance Metrics
3. System Improvement for Encore

What needs to improve?

1. Codebase (Bloated, heavy compute)
2. Localization Accuracy
3. Wiring
4. Pre-demo setup methodology

Performance Evaluation in SVD

Req.	Description	Status	Score
M.P.1	Cumulative deviation from latitude	Achieved - Global path planning methodology has been set up. We were only able to demonstrate a straight line for a single crater.	5/10
M.P.2	Navigation Accuracy	Demonstrated - The ROADSTER followed the generated global path to an average deviation of 8.16%. Metric will also improve with localization.	9/10
M.P.4 (Part 1)	Crater Avoidance	Demonstrated - Methodology for identification of craters to avoid set up. Shown in sim during SVD	8/10
M.P.5	Crater Grooming	Demonstrated - Groomed craters in both autonomous and teleop. Built a strong, capable machine for crater grooming	10/10

Performance Evaluation in SVD

Req.	Description	Status	Score
M.N.1	Weight	Achieved - The rover weighs 25kg. This number may increase with additions during the Fall. Need to demonstrate.	8/10
M.N.4	Size	Missed - The size of the dozing arms were increased to allow for backblading. The battery mounting extension arms need to be removed to meet this requirement.	3/10
D.N.1	Technological Extensibility	Achieved - We have maintained an Engineering Wiki and extensively documented our entire design process. Need to demonstrate.	8/10
D.N.2	Aesthetics	Demonstrated - Sponsor requirement. Design look is satisfactory with minor changes in cable management and colour schemes	9/10

Performance Evaluation in SVD

Video Excerpt

Conclusions after SVD

STRENGTHS

- Robust Tool Subsystem
- Compact E-Box
- Wheels
- Power Distribution Board (PDB)
- Management and Presentation
- External Infrastructure
- Software Integration

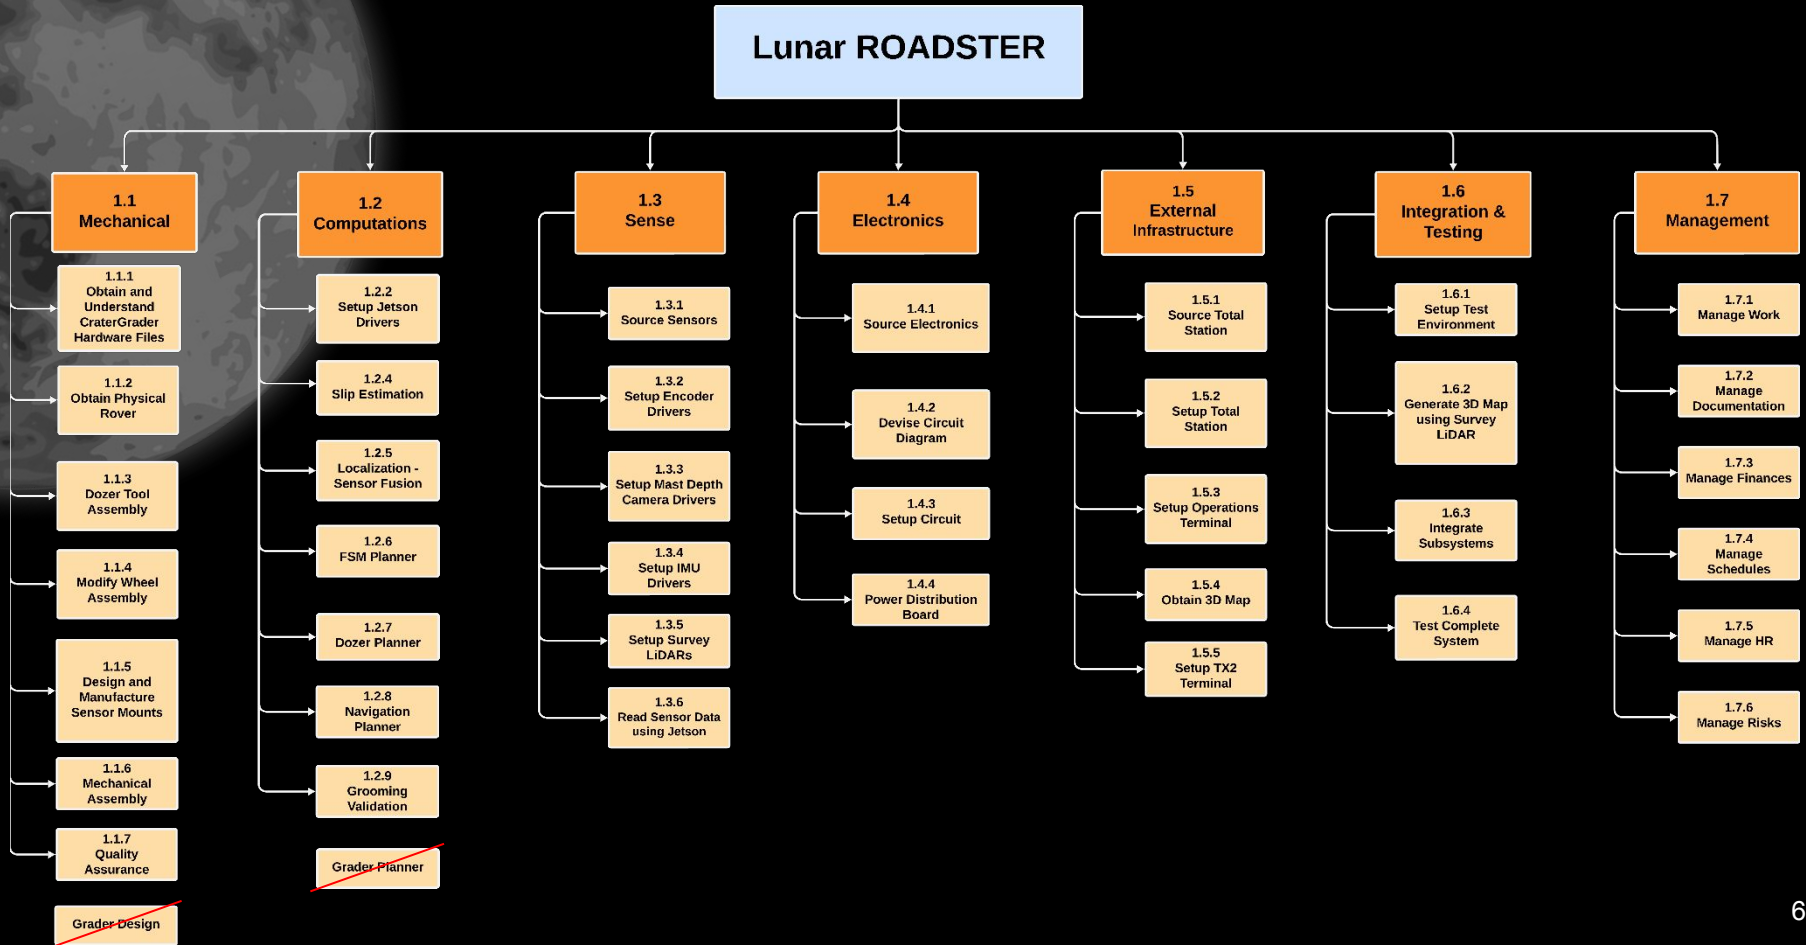

WEAKNESSES

- Mechanical Vulnerability
- Electrical Unreliability
- Compute Bottleneck
- Reliability of autonomy
- Demonstrating performance metrics

PROJECT MANAGEMENT

Work Breakdown Structure

Schedule

Major Milestones:

- All major spring milestones completed ahead of SVD
- Systems require improvement to meet FVD goals

Current Status:

- Achieved all promised goals for SVD
- Slight delays due to additional development for SVD Encore (higher compute requirements)

Plan to Improve:

- Upgrade to a higher-performance Jetson during summer
- Make final system adjustments to ensure system robustness before PR6

Fall Test Plan

Date	Event	Capability Milestones	Tests	Requirements
09/10	PR7	<ul style="list-style-type: none"> Hardware and software refinement 	Validate hardware upgrades, software fixes, and system stability improvements	M.F.5 M.F.9 M.N.3
09/24	PR8	<ul style="list-style-type: none"> Validation stack setup Wheel torque measurement Navigation tuning 	Detect robot stalling through torque measurement, adjust tool height, and verify smooth navigation through path execution tests	M.F.2 M.F.3 M.F.4 M.F.8 M.F.9
10/08	PR9	<ul style="list-style-type: none"> Autonomous grading of multiple craters 	Verify autonomous grading performance across multiple craters	M.F.2 M.F.3 M.F.4 M.F.5 M.F.6 M.F.7 M.F.9

Fall Test Plan

Date	Event	Capability Milestones	Tests	Requirements
10/29	PR10	<ul style="list-style-type: none"> SkyCam-based localization for improved global positioning 	Test SkyCam-based localization by checking rover's ability to self-localize accurately with / without external infrastructure	M.F.3
11/12	PR11	<ul style="list-style-type: none"> Full system integration Quality assurance testing 	Check all subsystems and units are functioning correctly	M.F.2 M.F.3 M.F.4 M.F.5 M.F.6 M.F.7 M.F.8 M.F.9
11/17 11/24	PR12 (FVD and FVD Encore)	<ul style="list-style-type: none"> Final system demonstration involving autonomous grading of multiple craters 	Demonstrate full autonomous operation by detecting, avoiding ungradable craters, and grading multiple suitable craters according to mission specs	M.F.1 M.P.1 M.F.2 M.P.2 M.F.3 M.P.3 M.F.4 M.P.4 M.F.5 M.P.5 M.F.6 M.P.6 M.F.7 M.F.8 M.F.9

Fall Validation Demonstration

Test Location

Planetary Robotics Lab Moon Yard

Sequence of Events

Prior Setup:

1. Prepare the Moon Yard with several craters and dunes in a circular path.
2. Scan the Moon Yard with a FARO Scanner to obtain a global map for navigation.
3. Attach and connect all the components and subsystems of the rover.
4. Place the rover in the Moon Yard and calibrate its localization using a star-sun tracker, visual odometry, and/or total station.

During Demonstration:

5. Switch the rover to autonomous mode and use goal poses with offsets to plan the path.
6. Observe the rover **autonomously grade craters and level dunes in a circular path.**
7. After each dozed crater, use the ZED camera to validate whether the dozing satisfies the performance requirements.
8. If anything unexpected occurs press the emergency stop button.

Quantitative Performance Metrics

- M.P.1:** Will plan a path with **cumulative deviation** of $\leq 25\%$ from chosen latitude's length
- M.P.2:** Will **follow planned path** to a maximum deviation of 10%
- M.P.3:** Will **climb gradients** up to 15° and have a **contact pressure** of less than 1.5 kPa
- M.P.4:** Will **avoid craters** $\geq 0.5 \text{ metres}$ and **avoid slopes** $\geq 15^\circ$
- M.P.5:** Will fill craters of **up to 0.5 meters** in diameter and **0.1m** in depth
- M.P.6:** Will groom the trail to have a **maximum traversal slope** of 5°

Follow a circular path

Groom several craters
in a circular path

Budget

Major Items	Units	Total Price
ZED 2i Stereo Camera	1	\$562.00
DC/DC Power Converter	1	\$315.51
Linear Actuators	3	\$290.00
Planetary Gear Motors	4	\$239.96

MRSD Budget	MRSD Budget Spent (\$)	MRSD Budget Spent (%)	Total Budget Spent*	Remaining Balance
\$5,000	\$2,309.07	46.2%	\$5,379.07	\$2690.93

* Includes items inherited from Crater Grader and Supervisor

><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div><div><div></div><div></div><div></div><div></div><div></div></div></div></div>	

Lessons Learned

- Check for common issues online while choosing hardware (Jetson and Zed issue)
- Schedule based on **resource availability** such as lab access and lead times
- **Plan for Progress Review goals** at the beginning of the semester
- Have a proper plan for demo **split between SVD and SVD Encore**
- **Do not choose a project where you have to build both software and hardware from scratch :)**

Fall Activities

- Integrate and test continuously
- Improve tool actuator
- Wheel torque feedback
- Tune overall software stack
- Solution to compute problem (new Jetson/code optimization)
- New localization method - SkyCam
- Planning for grooming multiple craters

Colonize the Moon!

- *Team Lunar ROADSTER*

“Starting with a foothold on the Moon, we pave the way to the cosmos”

Thank You!

2x Speed

Appendices

A.1. Derivation for M.P.5:

- Chang'e-4's landing site was surveyed and found that 97.5% of nearby craters were below 15.5 meters in diameter.
- Our rover is approximately 1/30th the size of a commercial grader, so it shall be able to grade $15.5/30 \approx 0.5$ meter craters at least.
- Source: DOI 10.3390/rs14153608

A.2. Derivation for M.P.3:

- Average depth-to-diameter (DtoD) ratio of 0.07 near the North pole
- Assuming worst-case scenario of a crater with twice DtoD ratio of 0.14, the gradient is $\theta = \arctan(0.14*2) \approx 15$ degrees
- Contact pressure requirement follows recommendation from NASA
- Source: DOI 10.1029/2022GL100886, NASA/TP—2006–214605

A.3. Derivation for M.P.1:

- Recommendation from Nature paper on extraterrestrial path-planning metrics
- Source: DOI 10.1038/s41598-023-49144-8

Risk Management (Extra)

Risk ID	Risk Title	Risk Owner	Type	Description	Consequence	Risk Reduction Plan
R1	PRL Testbed Scheduling	Ankit	Scheduling	PRL Testbed unavailable due to scheduling conflicts with other high priority projects	No testbed available for testing and/or SVD	Devise and discuss a testing and demo plan with Red and other stakeholders of the PRL testbed beforehand and reserve slots
						Reach out to external testing facilities like Astrobotic or CAT for a backup testing facility
						Schedule tests at night
R2	Excavator and grader tool planner takes longer than expected to deliver	Simson	Technical	Integration of the excavator and grader software with hardware takes longer than expected	Unable to meet SVD deadline and potential requirements change	Shift requirements for SVD
						Integrate the grader during Fall semester
						Potentially use off-the-shelf code if available, preferably from CraterGrader
R3	Integration issues between subsystems	Deepam	Technical	Subsystems work individually, but integration and communication between the subsystems are flawed	Delay in integration causing scheduling overruns, requirements change and failure of the demo	Perform unit testing and subsystem validation continuously
						Integrate one subsystem at a time
						Use a common framework (e.g. ROS2 interfaces) for communication between subsystems to reduce bugs
						Keep to planned schedule and have at least 5 weeks for testing and integration
R4	Belly depth sensor is not suitable for validation	Bhaswanth	Technical	The belly depth camera is used to validate if a groomed crater is satisfiable. The sensor may not be able to adequately determine depth variations suitable for validation	Will result in major revision and changes to the validation architecture and functional requirement, causing delays in scheduling	Mount the depth camera at another location on the rover (e.g. on a mast)
						Use another sensor to determine depth variations (e.g. LIDAR, visual odometry, IR sensor)
						If all else fails, use the total station for validation

Risk Management (Extra)

Risk ID	Risk Title	Risk Owner	Type	Description	Consequence	Risk Reduction Plan
R5	Unable to get Crater Grader to perform autonomous crater filling	Bhaswanth	Technical	Our rover builds on top of the work accomplished by Crater Grader. If we cannot get Crater Grader to perform autonomous crater filling, we may need to spend more time working on the navigation stack and designing the entire pipeline	Extra time commitment to start from scratch or obtaining a suitable replacement	Thoroughly go through Crater Grader's code and the mechanical schematics provided
						Test each component and wiring to see if they are working
						If it is still not working, inherit only the software component from Crater Grader and build hardware ourselves
R6	Delay in arrival and manufacture of hardware components	William	Schedule	Shipping delays of components ordered and/or manufacturing delays on custom made components	Delays in hardware integration, causing pushbacks in scheduling and software development	Use off-the-shelf components that are available on hand (e.g. from CMU labs or Red's workshop)
						Start ordering and designing components during Winter break so there is adequate leeway for delivery and manufacturing before Spring semester starts
						Use simulations to work on software components while we wait for the components to be delivered and/or manufactured
						Implement other subsystems that are independent from the subsystem that is missing parts
						In case of delay in wheels, work with the existing wheels and proceed with the timeline while waiting for the new ones to arrive.
R7	Lack of proper simulation environment	Simson	Technical	Inability to accurately simulate the rover in a Lunar-like environment can lead to suboptimal performance	The rover's performance in the Moon Pit may be compromised, leading to inefficiencies, mission delays, or potential failure in achieving key objectives	Ask CraterGrader how they ran all their simulations and gather resources
						Explore LunarSim - https://github.com/PUTvision/LunarSim and check how useful this will be, during the winter break
						Develop Gazebo environment

Risk Management (Extra)

Risk ID	Risk Title	Risk Owner	Type	Description	Consequence	Risk Reduction Plan
R10	Mast depth camera FOV is blocked	William	Technical	Mast depth camera's FOV can be blocked, partially or completely, due to dust, misalignment of camera, or interference from the rover's own excavator assembly.	Hinders the rover's ability to perceive its surroundings accurately, resulting in navigation errors and inefficiencies in excavation tasks	Conduct field tests to choose an optimal height to place the depth camera such that dust does not reach it and it can clearly see in front of the rover, despite the excavator assembly. Ensure that visual data such as depth perception and object detection should not be compromised
R11	Too many performance requirements	Ankit	Technical, Schedule	We have a lot of performance requirements and we may not be able to meet all of them by April for SVD	Delays in testing and validation, impacting project timelines and April SVD Demo results	Have revised performance requirements separately for SVD and FVD (focus more on SVD)
						Talk to CraterGrader and discuss what is feasible and what is not in the given time
						PM should track schedule properly and team members have to push to meet the timeline
R12	Drive system wear-and-tear causes malfunction	Deepam	Technical	The transmission and steering assembly might be worn out, leading to suboptimal vehicle dynamics, and potentially mechanical failure	Rover drive system fails and may require a lot of repair and maintenance	Thoroughly check the Crater Grader's assembly and carry out maintenance of any worn-out parts
						Completely replace the assembly parts with the same/similar new parts for better performance and reliability
						Added limit switches to avoid steering gears to operate beyond their limits
R14	Dust ingress	William	Technical, Cost	Due to significant sand manipulation, the flying sand/dust can enter and accumulate over sensitive electronics (PDB, drivers, Arduino) and sensors (cameras, IMU), leading to component failure or incorrect sensing	Component failure during testing or demonstrations. Highly inhibits all future scheduled tasks	Design proper sand enclosures and mounts for sensitive components
						Review placement of components
						Review scale and speed of sand manipulation to eliminate root-cause of flying sand/dust
						Allocate contingency budget and order spares of the sensitive components in case of component failure

Risk Management (Extra)

Risk ID	Risk Title	Risk Owner	Type	Description	Consequence	Risk Reduction Plan
R16	Code version control	Simson	Technical	Code modifications or config parameter changes during testing might not be saved, affecting the final demo. Reverting to a stable version is difficult if changes do not work as expected.	Delay in code integration and implementation	Implement GitHub version control to store and retrieve the best versions of code and configuration
						Use Google Drive to backup important documentation explaining setup processes
R19	Items missing	Ankit	Logistics	Critical project items may go missing if not stored properly or tracked. Items may be misplaced or borrowed without proper logging	Delay in hardware implementation	Maintain an inventory tracking spreadsheet
						Include spare inventory
R20	Sensor ROS packages not available	William	Technical, Schedule	Finalized sensors might lack compatible ROS packages, leading to delays or significant changes in the software architecture	Delay in software implementation	Perform trade studies to pick sensors that are compatible with ROS versions before finalizing
						Select sensors and ROS versions that minimize potential conflicts
R23	Lunar-accurate cut/fill regions are not possible to groom	Simson	Technical	The rims of the craters may not be enough to fill the whole crater. Going to a different region to carry the sand to the crater may prove to be inefficient	The basic assumption of sand availability fails. We may need to rethink the basic concept of tool planner to fit the new parameters of the environment	Accurately create the environment and assess if the rims are enough to fill
						If not, modify PRs accordingly

Risk Management (Extra)

Risk ID	Risk Title	Risk Owner	Type	Description	Consequence	Risk Reduction Plan
R24	Sensor data is too noisy to fulfill performance requirements	William	Technical	Performance requirements are tough and ambitious, sensor noise may prevent us from achieving it	Failure to demonstrate performance requirements may cause us to lose marks in the demonstrations	Relax the performance requirements enough to ensure that they are achievable
						Ensure enough testing time to tune parameters
R26	Off-the-shelf wheels don't interface with the rover	Ankit	Technical	No off-the-shelf wheels fit the rover, We'll have to redesign wheel hubs and mountings as per the new wheels.	Continue with sub-optimal wheels that the rover currently has, thus, not meeting one of the non-functional requirements	Shift requirements to FVD
						Good enough market research to see find the best fit, with least amount of changes

Risk Management (Extra)

R27	TX2 Integration	William	Technical	Unable to login to TX2 and interface with a LAN network for transmitting data over WiFi to Jetson	Delay in finalizing localization stack	Set up a new TX2 (Re-flash the TX2). Reach out to previous teams to understand their methodology and retrieve credentials
R28	Electrical hardware finalization	Ankit	Technical	E-box Design dependence on to-be manufactured PDB.	Not meeting the hardware deadline	Use previous knowledge and account for a placeholder in the design
R29	Access to FRC Workshop	Deepam	Logistics	Without access, no hardware fabrication/repairs can be carried out in the absence of Tim	Not meeting the hardware deadline	Try other fab-labs on campus. Request Tim, John or Red for getting temporary access, if not permanent
R30	No spares available	Team	Logistics	Discontinued model, spare parts unavailable	The whole project falling through, or redo almost all subsystems on a different rover.	Check out eBay and other similar platforms for spares Check out and stock similar parts if not same Find a twin rover that was used by a previous team on campus Maintain all parts, especially mechanical parts
